

Using nGage for Healthcare Transformation

Studies demonstrate that high levels of process adherence that lead to highly improved quality results are capable in healthcare. Unfortunately, it has been difficult to replicate these processes consistently because of culture and management differences.

Proventix has a vision to create a healthcare changing technology utilizing two main components.

- Automated Monitoring of Quality Events
- Active Communication at a Constant Entry Point to Healthcare Worker and Patients

Peter Pronovost, M.D., Ph.D., Atul Gawande, M.D., and others have demonstrated the opportunity to improve care through collaboration and check lists for consistent processes. They have used the terms “science for performance.” Unfortunately, departments in the same hospital adopting the same models receive different results. It is difficult to create a replicable culture, but Proventix believes that by providing consistency of monitoring (mostly automated) and real time feedback unique to healthcare workers’ specialties, a culture of quality can be created through the nGageTM system.

Proventix believes in a concept we will call “Health maintenance technologies”. It is the combination of deploying in all healthcare settings manufacturing-like monitoring capabilities and active two way communication that can predict and proactively prevent poor quality outcomes.

No one can say we don’t have a big vision.
